

I've called Tim over. Yep.

All right. I should go to the test room. The setting needs a few minutes.

All right. Yeah.

You all been recording? Cool. How do we facilitate this part of the conversation? So... Maybe let's start from what break looks like. So at the end of this project, I want to be able to send A link. Just somebody? And I want them to be able to register a company. Yup. And... Do we need down to be registered as a user first. Or is it part of the user registration where you can... Create a company. So what is the user for right now?

I'm imagining that the user flow It is... I've got my shoppers details, my shopping history, my My order status. Yep. So If that statement is true, then I would say no. They don't need to be A user. They can be a user. But the user-The company. are two different Personas here. Okay. Do How does the company creation process or flow differ from the user creation. Creation of all. There is potentially more information That needs to be added. Um...

They have a company They might have employees. Mm-hmm. There's probably Uh, a mechanism for them to attach A payment gateway of some sort? Um... And then a way for them to upload Inventory. And then When you say update inventory, you mean update their product catalog or actually Looking at their inventory of saying like oh, this is what I should order not because there's only three books Yeah, both so First, they need to be able to Give the system the things that they have to sell.

Then we need a system that allows us to to manage that, which includes inventory and all. all of those things, notifications if things are running low. And then there's a dashboard. That dashboard will allow them to see the outgoing orders, Maybe there's some fraud deduction in there. So we're just going through the requirements. I'm having some stomach troubles right now that are a little bit-yeah.

I'll be OK. But yeah, sorry about that. No worries.

And right now we're we're going through the company sign up flow perfect so we're We're coming to a point where we can test the user login. The user login and the company flow are two different flows. Um... There will be some overlap.

That overlap is that as a user I can log in, the question is which tenant am I logging into? Mm-hmm. So we need, as part of this company flow, we need to assign it a tenant.

you And Um...

Um A way to customize The weight is set up. What else?

The way I see it is like it's a complete Different portal where you're logging as a company Okay. Like you said, like a user has a Shopping history and they can buy stuff that's Mainly in the core

functionality that already exists. the company portal or company login. Allows someone to manage preferences, like you said. Upload the product catalog, maybe you have the reporting section about Like you mentioned before as well, The inventory status or the sales, at LA, so I don't know.

This part can be done in a separate milestone. Uh... Do we want... Do we want multiple users to have multiple roles? Someone at company A can have access to the dashboard because he works with the warehousing people. Yeah, so employees Yeah, so employee types or employee roles for a company. And it could be read-only, it could be admin level. Some people can update or manage the... Now the catalog, other, not really.

And then I guess another question is, and then again just going back to the overlap here with users, right, because we have multiple tenants, And If company A And Company B have different products and they're completely different. But I'm a user and I want to shop at both. Do I have a new account for both? I log in with the same account. I do, the same account, I feel. Yeah, so there's a network, I guess, that you can operate under, but do you automatically have an account across all of them?

That might be comfortable for companies I like. Do I need, like, are my product available platform wide or only for my tech?

Yeah.

We're transcribing? Okay. Should I say a bunch of words? Whatever you say. If I were transcribers, I would just put little asterisks when I say the F word. Maybe we'll level set to where we're at right now and then what we're thinking. We've just completed milestone one which means is that we've got our workflow setup. We've got current state assertions, so the tests that we had in this brownfield application were pretty minimal.

Because we're making such a big change, we want to make sure that the current behavior of this This website still works as a...

The behavior's gonna change drastically when you update it, right?

But I should still be able to buy a book from this one particular company, right? That assertion might change, but we wanted to have a clean slate, like as of today, this is how it works, how we do our stuff. Yeah, so we've got this current state now where we're just finishing up this solo end-to-end. Um... Test workflow. Next is the multi-dev workflow that we want to test out, which means is that we need the full requirements.

Right now, in the brownfield application, there's only mock user authentication. So you can't sign in. As part of this test, we're enabling that functionality in the current state. So you should be able to log in. Which now leads us to really what we're trying to get to and that's the white labeling aspect of this project. And I think the multi-tenant architecture. That's, it's all, yeah, it's all part of it.

So the, how would--I consider like white-labeled more of a feature of a... Maltitan, yeah. Okay. The core, like architectural changes Look at this, making a multi-tenant. Supporting multiple times.

Yeah, good distinction, an important one.

My current project has the same exact thing, except for their multi-tenant art, like, Parakeet. doesn't support what they want to. So they're gonna have to completely change it but this is like a product in production. With like realThe user is lying in it. That's right, yeah. What client? Inspira Financial. Inspira Financial. They do like, Health savings account, consumer driven benefit type stuff like the non-health insurance portion of your benefits.

I don't know how it works in Canada if you guys get that same stuff. Wait. Cool. They have a, I don't know,I heard. \$68 billion assets under management. Wow.

That's a few. Yeah.

A little bit then yoga store.

A little bit more. A little bit more, but we'll get there. Eventually. Once we get to number four. Once we get to number four. Yeah.

So as far as like deliverables, I would say like,Like, we'll take it from a technical point of view first, but like,From an engineering point of view, the data model's been updated, so like, if tenant one will never see tenant two's data, I would say, like that's an assertion.

Yeah. So now let me ask you this. If I'm a user, wanting to shop in tenant one and that same user wants to also shop in tenant two. Am I logging in with the sameAuth, do I?

I would say do whatever is easier for this exercise because the point of this is not off, you know? Yeah. So make that decision based on what is easier for you guys to implement. Okay.

Um So the flow that we're thinking through right now And this is where I'd like your opinion is Um... I am a company and I want to start selling products with this service. A salesperson would send a link to to sign up as a company. So I'm putting in my information, including the name of my store, right? So vitamins for dogs. That's the thing that I'm going to sell. So I put my store name. You guys are basically building Shopify, by the way. Yeah, yeah.

Um... But with agents.

But with agents, well, so are they now, to be honest. I think they laid off half their company.

And also. there a couple years ago. -From Sol.

Oh yeah?

Is he back in slalom now? He's not back in slalom.

He's still there though.

So So as a company I can now sign up. Part of that signup process will be defining what my What I'm selling How we're gonna sell it, so gateway information I assume. I have to be able to take payments. And I have to create a catalog of things to sell. So I have to be able to upload my inventory.

Yeah, I would say for the purposes of this week. If you can't create all those admin interfaces to upload your product catalog, just seed the data and pretend.

Yeah.

Make some product decisions around what do we actually need to build versus what can we kind of like. pretend we built and then just see the data however you need it.

That's actually a really good call. I think we need to have seeding as part of our workflow. Which we kind of already have.

Out. We just need to make itLength to a company or a customer.

Yeah, so we've got the pre-existing seeding but we need to be able to add new inventory, new users and new companies into that.

Um...

As far as the front end, I was just thinking if this was a real thing, they would probably do domain-based routing or something like that, based on some domain or a custom A name or something. But for you guys, just come up with a way to demonstrate it in a browser. It could be a path or whatever you want it to be to switch tenants. It doesn't need to be a real deployed productYeah, agreed.

I think we can add like the u-store slash org1 slash org2 slash org3.

Exactly. Yeah. 'Cause you're probably running off a local host for your demo, so you can't-- Definitely. I mean, technically you can with your host file, you can add custom subdomains and then detect it, but that's probably too much. Yeah.

Is there anything else you'd want to see?

Well, like for your demo, you should do a five minute demo of the actual product you build if you get it working enough to demo it and then go and talk about your workflow and stuff for the rest of the time. 'Cause I think each team will have about 30 minutes. So you could spend, I would spend more than 10 minutes demoing the actual thing you built. I'd spend the rest of the

time talking about what you learned and the challenges you guys ran into and all that kind of stuff. Mom.

I think yours is probably the most unique team here as well I think a lot of the other teams did exactly the same so this may be the only interesting presentation tomorrow no pressure and it's definitely more like what we actually see on real real client engagement so I mean like the learnings from from this team, like I want to broadcast that to everybody else as much as possible.

I think it's something we need to Start documenting from every step of what we're doing, like the problem we had yesterday, the problem we have today, and kind of keep this as a list.

Yeah, use AI to create your presentation and stuff like that too. You can feed all your transcripts into it even. Yeah.

Do we need to put a deck together?

What's the--Yeah, I don't see you putting a deck together. It doesn't need to be a PowerPoint deck though. I think we have a tool you guys can use that's more like developer focused. Okay. They'll like it better. Yeah, all right. And I think agents can work on it for you too. Oh yeah.

So that'll save you some time. Cool. You don't have to move little boxes around.

As far as other things to see in the demo, I think you should show a couple, at least two tenants configured with different products. Um... You know, the ability to like go through and buy something.

Yeah, well, yeah. Would it make sense to maybe spend a part of the whole way our because one of the things that we focused on at the beginning and it's still part of everything we think about is Being able to We're part of a team, whether it's ReelDAV or agents, and what part of our workflow kind of influenced that. Apart from the end result of the application, but mostly focused on theWhat kind of work together, you mean?

Yeah, absolutely, you should talk about that. What worked and what didn't work? What kind of conflicts did you run into? I mean, that's the whole point of this. Immersion workshop is like, let's try a bunch of the most advanced techniques we have in a small group and see where the collisions happen. See what else people can come up with, new techniques. Like the metal people came out of this immersion workshop, not one trial, but it came out of the immersion workshop.

No one had done that before the first one of these. Interesting. Yeah, when I saw that demo for the first time I was like, "Oh, wait." It was Ryan Henderson who left a couple months ago, but he had five things going at once. He was like specing something, planning something, executing something, all at the same time. Like, holy God, this is actually accelerated engineering. Yep. Yeah. Not autocomplete, you know?

Okay.

Cool. I think we have our...

As far as work trees go, Don't. Don't go down a rat hole that you can't pull yourself out of. Yeah, yeah. If it takes too long, you know. Yeah.

And it's only useful if you want to demonstrate multiple agents on the same machine at the same time. Yeah. Right.

That feels like more of an optimization to me.

Yeah, we've got issue locking right now, so, and the, The agents are able to identify your pessimistically locking issues.

Yes. Your optimistic locking.

Yeah. So even the dependent stories are all locked or any area of the application that overlaps, even if they're unrelated, it's all locked.

I used to ask pessimistic and optimistic blocking questions in interviews to Scott. I'm going to tell you that most people couldn't get those questions right. I'm not surprised. Even senior principals couldn't get them right. Yeah.

Yeah.

It's a concept that we don't really use anymore.

They just ignore it. They just have whoever hits save last wins. That's literally the architecture of most things we end up building these days. Yeah.

You have a problem? Merge it! All right. Yeah, thank you.

Thank you. Okay, good luck.

Hopefully your agents will be speedy.

So far so good.

Yeah, so where's-Three tasks out of four completed for the user thing.

And it's just verification and sequencing on the left.

Wow. It's all we know that 71 to 10 and company in the morning. Yes, we've talked about it before.

So are we at a state where we can test this yet?

I just need the 4.1 and focus test for retracement, deprecation, email rejection, stuff like that. More and more like validation, I'm almost done with three. So, um... Yeah, I guess in a couple of minutes. In the meantime, I think you can take that and see what it does with the specs.
